INTRODUCTION

The Allegheny County Hoarding Task Force is a collective group of individuals working to accomplish the mission of the Task Force. The Task Force does not have and cannot accept funding and does not engage, intervene or consult on individual hoarding cases, concerns or situations.

*The mission of the Allegheny County Hoarding Task Force is to better understand the nature and extent of hoarding, increase education and awareness and coordinate community resources in Allegheny County, so community services are better able to respond to individuals with hoarding disorder.*

Combating and mitigating hoarding in our community requires a multi-disciplinary approach and cannot be overcome by any single agency or discipline.

This document has been created by members of the Hoarding Task Force Education Workgroup. Information in this document has been developed by its members through professional experience and research. This document is not meant to replace professional or legal advice. It is a first step to learn a bit more about hoarding and hoarding disorder and the complex issues that are faced by people with this disorder.

**Target Audience:** Community segments and organizations that do not exclusively work with individuals with a hoarding disorder, but may come across hoarding in their line of work, such as code enforcement, municipal workers, first responders, insurance industry employees among other populations that are seeking more information about hoarding disorder.

**Purpose:** Examine multiple components of hoarding, including hoarding disorder basic definitions, stages of hoarding, risk factors, safety and interaction.

Sincerely,

Allegheny County Hoarding Task Force

BACKGROUND AND DEFINITIONS

WHAT IS HOARDING?

Hoarding is the excessive acquiring and accumulation of items along with a persistent inability to discard items because of a perceived need to save. These items may have little value or utility. The thought or action of discarding an item will cause discomfort and distress.

COLLECTING AND HOARDING

▪ **Collecting** – A person who collects items of a specified type, professionally or as a hobby.

  A collector differs from a hoarder in that a collector displays and cherishes their items while being able to set boundaries on their acquisitions and fully understand their collection’s actual value.

▪ **Hoarding** – Hoarding is the excessive acquiring and accumulation of items along with a persistent inability to discard items because of a perceived need to save. These items may have little value or utility. The thought or act of discarding an item will cause discomfort and distress.

An individual suffering from hoarding disorder has persistent difficulty discarding or parting with possessions, regardless of their actual value.

COMMON CHARACTERISTICS OF AN INDIVIDUAL WITH HOARDING DISORDER

Individuals with hoarding disorder are often stigmatized. The Hoarding Task Force Education Workgroup has reflected on their experiences working and supporting individuals with hoarding disorder and has developed the following list of common characteristics about individuals with hoarding disorder. Individuals with hoarding disorder are often…

▪ Visual learners
▪ Highly educated
▪ Creative
▪ Passionate
▪ Have strong environmental concerns
▪ Enjoy giving to others
▪ Enjoy reading
▪ Strive for knowledge
DEBUNKING THE MYTHS OF HOARDING

In the left-hand column below, a common stereotype about individuals with hoarding disorder is presented and the right-hand column a more common reality is presented. Information in this section was developed based on discussion with professionals on the Hoarding Task Force Education Workgroup based on their experiences.

STAGES OF HOARDING

Hoardiing disorder is chronic and progressive, meaning hoarding is likely to increase over time. The Clutter Image Rating Scale is used to determine the extent of clutter. For more information about this scale please click on the link below. The clutter image rating scale uses 9 stages, however in the descriptions below a 1 to 5 scale is used, with stage 1 being least advanced and stage 5 most advanced.

- The categories below outline the stages of hoarding. Click the link below to access the Institute for Challenging Disorganization Clutter Rating Scale for more detail:
  - https://challengingdisorganization.org/resources/clutter-8211-hoarding-scale

STAGE 1

Stage 1 following the Clutter Image Rating Scale is the least advanced level of hoarding. At this stage hoarding behavior and habits become solidified.

Below are common characteristics that may present in stage 1

- All doors and stairways are accessible
- All amenities are accessible and working
- Functioning bathroom and clean clothes
- All family members and pets are healthy, clean, and well nourished
- Maintained finances
- Invites friends’ over
▪ Not generally viewed as a hoarder
▪ Feelings of anxiety about their clutter, with minimal effects
▪ Pet behavior and sanitation is generally appropriate
▪ No excessive clutter
▪ All rooms are being used for their intended purpose

STAGE 2
In stage 2, indicators of hoarding become more identifiable. Safety issues are starting to arise and impaired functioning is starting to present, including accessibility and mobility constraints.

▪ One exit to the house is blocked or one room is unusable
▪ One major appliance is not in working order because it is too difficult to access
▪ Less attention is being paid to housekeeping. (e.g. Dishes are piling up and shelves remain dusty)
▪ Pet odors becoming noticeable.
▪ Shift in focus from life to clutter.
▪ Diminished social and family interaction
▪ Reduction in the number of guests they have over because of embarrassment
▪ Mild anxiety and depression
▪ Shifting from embarrassment to justification
▪ Visible pet fur, hair and dander
▪ Light to medium evidence of pests and/or insects
▪ Inconsistent routine housekeeping and maintenance
▪ Slight congestions of exits and hallways
▪ Clutter obstructs some living area.
STAGE 3

Stage 3 is the mid-point on the Clutter Image Rating Scale and signs of hoarding are starting to become evident to outsiders.

- Indoor items may be stored or tossed outside
- Minor structural damage
- Evidence of excessive extension cord use and phone lines when outlets get blocked off
- Pets may have fleas
- The kitchen sink may be full of dishes and standing water
- Stairs and walkways are generally extensively cluttered and difficult to navigate
- Outside storage (shed or garage) is overflowing
- Personal care is neglected
- Consuming reheated, precooked, or fast food because the kitchen is only borderline functional
- Decreased physical activity
- Family has attempted to intervene numerous times and is faced with rejection and withdrawal.
- Work place problems
- Growing financial concern
- Clutter obstructs functions of living area.
- At least one room is not being used for its intended purpose
STAGE 4

Stage 4 consists of advanced structural damage in several areas, including sagging floors and ceilings. Major appliances are no longer working properly or at all. The house and contents pose a significant safety risk to occupants. Additionally, individuals will not have access to fresh foods and safe/workable food preparation area and utensils.

- Mold, bugs, and cobwebs may be present
- Contents are stored in uncommon places such as clothes hanging on the shower curtain rod or important documents in the oven
- Individuals who hoard will remain in very small area of the house, “The Cockpit”
- Bathe in the sink or not at all
- Struggle to get to work on time or no longer working
- Significantly behind on bills and other serious financial troubles
- Utilities may be shut off
- Pets may have run away or died in the house
- Individuals may have shut everyone out of their lives
- Water damaged floors
- Broken walls, foundations, windows/doors
- Rooms cannot be used for their intended purpose
STAGE 5

Stage 5 is the most advanced and profound stage. Hoarding is evident and the property is highly unsafe and inhabitable.

- Major structural damage to the house
- Severe mold, strong odors, bugs, rodents, and cobwebs
- Entire floors of the house might be blocked off
- Walls of items in every room
- Struggling to complete simple tasks like eating, sleeping, using the restroom
- Limited to consuming soft drinks, fast-food or expired foods
- Family and friends (if they are still in contact with them) are deeply concerned
- Serious financial problems
- Severe, debilitating depression
- Confusion
- Isolated to their house, unless it is to move into their car or a homeless shelter
HOARDING DISORDER RISK FACTORS

The purpose of this section is to identify risk factors (antecedents) that may lead an individual to hoard. These factors may be a combination of physical, psychological and environmental. Information in this section is developed from conducting a literature review of hoarding risk factors and reviewing professional experiences working with individuals with hoarding disorder.

AGE

Hoarding appears more commonly in older individuals, as the disorder is progressive. Hoarding is likely to have started at a much earlier period of life, however the effects may not be observed until the individual is older. The Mayo Clinic reports hoarding usually starts around age 11 to 15 and progresses throughout life.

DEMENTIA

Dementia creates changes in the brain that can lead to hoarding, according to the Alzheimer’s Association. They also report hoarding may develop in the early and middle stages of dementia. Like other individuals that hoard, individuals with dementia

- Forgets to discard things
- Have difficulty distinguishing items that should be kept or discarded
- Have difficulty remembering where items are stored, placed or hidden

DEPRESSION AND ANXIETY

50% of clients with hoarding disorder have a major depressive disorder as well.

SOCIAL PHOBIA AND ISOLATION

People with hoarding disorder are more likely to be socially isolated. Their past experiences have caused them to distrust people and they find interacting with people often causes emotional or physical pain. Individuals who hoard may prefer material comfort.
PERSONALITY AND DECISION MAKING

- According to the Mayo Clinic, individuals that have hoarding disorder may be more indecisive, taking longer to make a choice to throw away or keep an item.

- Suffer from chronic disorganization which makes deciding very difficult since they are unable to clearly outline a purpose and need for an item.

TRAUMA AND STRESS

Most individuals who struggle with hoarding have a history of trauma. As a means of coping with the past, individuals seek comfort in possessions. Sometimes these possessions create a physical barrier between them and the persons or world that harmed them. Other times folks who have suffered abuse, neglect, or rejection turn their affections towards items and the joy that they bring serves as a substitute for healthy interpersonal relationships.
CLEAN UP AND REMEDIATION

The concept of a clean-up can be a very stressful situation for an individual who hoards. Because of the emotional attachment to the items, this can a very vulnerable time for the client. When helping a loved one processing their items, it is important to allow the client to make the majority of the decisions on their own. This process requires compassion, patience, and understanding on the part of the individual assisting the client.

Unfortunately, if a clean-up requires professional services, these can often be costly. A clean-up could cost upward of $5,000 or more, but is very situational

- If biohazards are present
- Property size
- Property condition
- Property location
- Property/utility damage
- Level of client involvement

ROAD BLOCKS AND BARRIERS TO TREATMENT

There are many road blocks and barriers to clients successfully accessing, receiving and progressing through the treatment and clean-up process. Information in this section was developed through common research and members of the Hoarding Task Force reflecting on common road blocks and barriers they have identified as part of their professional experiences.

MONEY AND FINANCES

Money is a common barrier to treatment. Individuals that hoard may not be financially equipped to engage in an intensive clean out program. A clean-up could cost around $5,000 or more.

If an individual is covered by health insurance, they may be able to access therapy services. Health insurance will not cover the cost of cleanup and remediation.
CLIENT SELF-INSIGHT

Clients may lack full insight into the extent of their hoarding situation and may be unready and unwilling to improve their situation. Some may be unable to comprehend the size of their clutter and feel their issues are more related to a lack of space or lack of organization.

PHYSICAL ABILITY

Individuals who hoard may not have physical ability to clean up because of advanced age, fragility or physical disability. Individuals should be encouraged to participate to their full potential and be an active member in the cleanup process.

SUPPORT

Hoarding is often isolating. Many individuals that hoard are ashamed and embarrassed and hide their situation from others. Lack of support can lead to isolation, depression, anxiety among many other issues.

STIGMA AND DISCRIMINATION

The stigma of having a hoarding disorder may be at the core of why an individual does not seek treatment. With the way, the disorder is negatively portrayed in the media, an individual may be more comfortable hiding the illness and withdrawing from those around them, rather than becoming vulnerable to critics. Special care and sensitivity needs to be taken to engage an individual to accept services.

TRANSPORTATION AND COMMUNITY ACCESS

Access includes transportation and physical and community access. Individuals in rural areas may not have access to public transportation.

An individual may have to drive an hour or more to be able to receive support, treatment or socialization.
LEGAL SUPPORT FOR PEOPLE WITH A HOARDING DISORDER

- Individuals diagnosed with hoarding disorder are protected under the Americans with Disabilities Act (ADA).
- Individuals with a hoarding disorder diagnosis are entitled to reasonable accommodation.
- Contact your local legal aid organization or ADA coordinator for additional information.
- Your local ADA coordinator can advise you of your rights and responsibilities under the ADA law

If the safety of children, older/vulnerable adults is suspected or in question, contact the appropriate protective service agency.

SAFETY AND PRECAUTIONS

Hoardings situations require special safety measures. This section discusses safety precautions that can be used to mitigate risks in a hoarding situation. Each hoarding situation is unique, so understanding the extent and degree of hoarding is important. Some hoarding situations may be advanced, with mold, dead or alive animals, including urine and droppings. Additionally, structural integrity issues and fire risks are increased.

Please note that hoarding clean up may require specialized services, such as mold remediation and hazardous waste management. It is important to seek these services when appropriate and not risk personal safety.

Information in this section was identified through primarily researching Centers for Disease Control and Prevention publications other web-site based resources.

ANIMALS AND VERMIN

Animals and vermin may be present in hoarding situation. It is important to understand that animal hoarding is different from attracting animals and vermin. Animal hoarding is distinctly acquiring animals.

<table>
<thead>
<tr>
<th>Rodents</th>
<th>Mice, rats, squirrels are examples of rodents that can possibly be present in a hoarded home. Rodents may carry disease causing pathogens in addition to causing damage from gnawing and chewing on objects, which may also create a fire hazard if chewing on electricity cords.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vermin and pests</td>
<td>Vermin is defined as a small, common, harmful or objectionable animal (as lice or fleas) that are difficult to control</td>
</tr>
<tr>
<td>Other non-domesticated animals</td>
<td>Raccoons, bats, feral cats and dogs may inhabit a severely hoarded property and potentially carry disease, including rabies</td>
</tr>
<tr>
<td>Domesticated animals</td>
<td>In a severely hoarded home domesticated animals may become trapped under debris or unable to access fresh food and water, as a result the animals will run away or die.</td>
</tr>
<tr>
<td><strong>STRUCTURAL DANGERS</strong></td>
<td></td>
</tr>
<tr>
<td>------------------------</td>
<td></td>
</tr>
</tbody>
</table>
| **Fire hazards**       | Accumulation of flammable and combustible materials in excess possess a fire hazard. Evacuation and rescue during a fire or other emergency may be compromised because the level of hoard. Some hazards include:  
- Multiple extension cords  
- Overloaded outlets  
- Blocked heating vents  
- Improper use and maintenance of appliances  
- Damage to electrical system  
- Occupant smoking without precaution |
| **Unstable surfaces**  | Depending on the extent of a hoarding situation, walking paths may be cluttered with debris, creating tripping hazards and affect balance. |
| **Inaccessible exits** | Many hoarded properties are at an increased fire risk. In the event of a fire or need to evacuate, exits may not be easily accessible or usable. Individuals with mobility impairments may be in particular danger |
| **Risk of collapse/entrapment** | Piles of clutter may collapse/cave in and/or shift, especially when disturbed by humans and animals. |
| **Damaged utilities**  | Gas lines, electrical sources may be damaged, leading to shock and fire hazards. Water and sewage pipes may be damaged, especially in older properties with brittle lead piping. |
Precautions should be taken and Personal Protective Equipment (PPE) used as appropriate to reduce risk of infection and contact with hazards in a hoarding situation. The type of interaction, hoarding severity and hoarded content will inform the precaution and equipment that should be used. The following precautions and PPE should be available to use in a hoarding situation.

Information in this section is gathered through web-based research. Information in this section is useful for general knowledge as each situation is unique. This document is not a comprehensive manual that addresses safety. It is designed to provide a general overview.

STANDARD PRECAUTIONS

Standard precautions should be taken when entering a hoarded property. Proper judgement should be used regarding the level of precaution needed.

The following are some examples of precautions that could be taken in a hoarding situation.

- Proper hand washing
- Ventilate work area as possible
- Change of clothes and change clothes before returning to personal residence.

PERSONAL PROTECTIVE EQUIPMENT (PPE)

Personal Protective Equipment, (PPE) equipment is used to protect an individual from possible hazards by creating a barrier between the environment and person.
SOME IMPORTANT PPE ITEMS ARE LISTED BELOW

- Durable work gloves
- Shoe covers
- Goggles/face shield
- Respirator/mask (two strap, N – 95)
- Protective gown
- Closed toed shoes.

WHEN ENTERING A HOARDED PROPERTY

Caregivers and professionals that enter the home are subject to a variety of health and safety concerns. The following are important steps to consider to safeguard yourself:

- Take only essential items with you.
- Place personal belongings into a plastic bag, seal it, and leave it near the door, to be picked up when exiting.
- Consider bringing a change of clothes in more severe circumstances.
- Avoid wearing loose fitting clothing, open-toed shoes, or shoes with deep treads that could hold pests or unsanitary debris. Consider using protective equipment (gloves, boots, gown, mask) in more concerning environments while weighing the impact this may have on the therapeutic alliance.
- Avoid sitting, particularly on soft-covered furniture.
- Do not lift, carry, or walk into areas you do not feel comfortable accessing.
- Be aware of your exits and paths. Avoid areas where piles can easily topple.

CLIENT SAFETY

It is important hoarding client’s safety be considered. The clients level of insight, will influence the mitigating safety factors the client is willing to take.

- Two accessible exits in every rooms
- Smoke AND carbon monoxide detector
- Emergency response system, when indicated
- Working and accessible landline/cellular telephone
- Area to store and prepare foods safely
- Working bathroom and utilities
COMMUNITY AND PUBLIC HEALTH CONCERNS

Hoarding in apartments and closely constructed homes create dangers for the community in addition to the individual that hoards. Community safety is effected because the consequences and risks of hoarding are often not easily confined.

Some examples of community risks due to hoarding include:

- Water damage
- Odors
- Fire
- Infestation of bugs, fleas, and other animal and pests that may travel outside the apartment/home.

FIRE AND MEDICAL RESPONDERS

When responding to an emergency, first responders are faced with increased safety risks in hoarded properties. Hoarded homes may not have direct paths and egress that prevent emergency responders from successfully carry out their duties. Hoarding situations create a substantial risk to both occupants and responders.

When approaching a hoarded property, responders may be able to identify a property as hoarded. An emergent situation is one that requires immediate response and mitigation by skilled responder.

When approaching a property, responders should view the exterior to determine if there is an indication of heavy contents.

Prior to entry, a responder must consider if their access is obstructed/limited by narrow or no pathways. Heavy storage close to the entryway and on the floor, may be indicative of heavy contents throughout the property. Dwelling entryway is the best image people show of their home, so a heavy content entry-way is unlikely to improve when navigating a dwelling.

Entering a hoarded home that is on fire is extremely dangerous for fire personnel. Hoarded homes may contain many flammable items creating an explosion risk. The fire may also weaken structural integrity, creating cave-ins and entrapment risks. Individuals that are trapped in a hoarded home that is consumed by fire are less likely to be rescued. Hoarding situations reduce the ability of fire personal to control the fire and preserve further property damage. Hoarding may increase the speed which fire spreads because the abundance of combustible material to serve as a fuel source.
When responding to an emergency, medical responders may not be able to identify the individual location and may be delayed due to removing and navigating debris. Additionally, removing an individual experiencing a medical emergency may be delayed and difficult, especially with heavy medical equipment, such as stretcher, oxygen and other emergency equipment.

CONCLUSION

There is a void in academic literature and research on hoarding disorders. Insurance will only pay for treatments that are “evidence based”, meaning they have been well researched treatments and proven to work. With little research on the topic of hoarding comes minimal approved treatments. This also affects the availability of funding for those struggling with this disorder.

Hoarding disorder research needs to be made a priority. As community members, we can advocate for more funding to be directed to hoarding disorder research and programs that assist those struggling with hoarding. Raising awareness and destigmatizing this disorder helps create an environment where those who once struggled silently can confidently reach out for help.

Kohler, K. (2017) Personal communication
